

Tree Pipit

Anthus trivialis

SEASONAL BEHAVIOUR

Detected on both spring and autumn passage, especially in April and October.

DISTRIBUTION

Can be seen in suitable areas throughout Sierra Morena.

COMMENTS

This species is a classic case of a little-known bird whose numbers are in all likelihood underestimated. It is very similar to the Meadow Pipit and can often be told apart only by its call, so it often slips through unnoticed. Official records don't tell the true story of this migrant.
